

I am

Identify trends in
crop yield,
livestock
production, and
food exports.

Integrate **real-
time agricultural
data** with
historical data.

A **policy expert**
shaping
sustainable
agricultural
strategies.

I'm trying to

Identify **historical food production trends** and patterns.

Measure the impact of **government policies** on food supply.

Compare **regional agricultural outputs** across different time periods.

But

There is **data inconsistency** across multiple sources.

Climate change is making **production forecasts unreliable.**

Food distribution networks suffer from **inefficiencies and inequality.**

Because

Many **historical records** lack **standardization**.

Global food demand has changed due to **population growth** and **dietary shifts**.

Supply chain disruptions (e.g., pandemics, trade restrictions) affect food availability.

Which makes me feel

Overwhelmed by
the complexity of
analyzing decades
of data.

Frustrated with
the lack of real-
time, data-driven
decision-making.

Worried about
the future of food
security and
sustainability.
